

Quick identification of mould and humidity with thermal imagers from Testo.

So that you can detect the humidity before your customer can spot the mould.

Damp interiors and mould won't stand a chance. Thermal imagers from Testo make it easy for you to keep an eye on all potential sources of risk. How? Simple: Testo thermal imagers calculate the humidity value of each measuring point

using the externally determined ambient temperature and air humidity as well as the measured surface temperature. And on your display you are immediately able to detect what is invisible to the naked eye.
